ACKNOWLEDGEMENTS

The research team (C A S E and GOTSIKI) would like to acknowledge and express gratitude for the contribution made by men and women of the Limpopo province who assisted with the collection of data across the province. Their contribution is inestimable, and it is due to their hard work that this study became manageable.

Acknowledgements

11

Primarily, the study instruments enquired about the availability of these basic municipal services, citizens' level of awareness regarding their availability, their quality, and levels of satisfaction with the service being provided, where applicable.

The current report provides a comprehensive situational analysis of municipal service delivery in the Limpopo province. In other words, the report documents information gathered on the availability, or unavailability, of services in all 26 municipalities across the province. In addition to reporting on the availability of services, the report further provides information on the citizens' level of awareness of various services as well as their perceptions regarding the quality and quantity of the services as well as their level of satisfaction and reasons thereof.

Six chapters constitute this report. Chapter 1 is the introduction in which a brief background of the study and the structure of the report are clarified. Chapter 2 reports on the methodological approach employed for the study. In this chapter, we explain various data collection techniques used to gather the information analysed in the report. Furthermore, the chapter highlights some of the limitations to be borne in mind when interpreting the results of the study. Key findings of the survey are presented in Chapter 3 and in Chapter 4 we present the focus group findings. Chapter 5 is the summary and conclusions, in which the results of the study are interpreted and analysis of what they could mean for the Limpopo provincial government and individual municipalities is provided. The sixth and final chapter is recommendations. The report ends with Appendix A and Appendix B in which we present the tables of the cross tabulation analyses conducted and the study instruments we used to gather data, respectively.

Introduction

DATA COLLECTION

Two data collection techniques were used, i.e., household survey and focus groups. The survey data and the focus group data were collected concurrently. Details of each of these techniques are provided below.

HOUSEHOLD SURVEY

A sample size of 5 200 interviews with household members across 26 municipalities was agreed upon. A total of 520 Enumerator Areas (EAs) were randomly selected from 26 municipalities and the research team set out to conduct 10 interviews in each to realise the sample size of 5 200.

Sample allocation per municipalities was done in two stages. The first stage was to allocate the number of interviews per municipality in proportion to the size of the municipality. This is to say that the municipality with the highest number of households was allocated the most number of interviews to be conducted in the area. At the second stage, the sample size was adjusted to bring some balance and to avoid a situation where significantly fewer interviews would be conducted in certain smaller municipalities. In the end, no fewer than 150 household interviews were conducted in a municipality, and in the largest municipality, 300 interviews were conducted.

In terms of household selection in an area, a starting point marked by a public place such as a local school, store, or church was identified from which the counting began. An interval of 10 stands in urban areas and 5 in rural areas was used. Upon picking the appropriate stand, the interviewers selected a household with main service connection point (e.g., electricity and/or water meter), where applicable. One interview was then conducted with head of the selected household, caregiver or a member of the household who is responsible for most household decision-making regardless of age or gender.

FOCUS GROUPS

A total of 8 focus groups with caregivers, head of households and/or household decision-makers were conducted. The focus groups were disaggregated by area type and gender. In total, 4 focus groups were conducted with female participants and another 4 with male participants. Two of the focus groups were with White urban dwellers and the rest were conducted with Black rural dwellers.

The focus group discussion guide focused on similar issues to those raised in the survey instrument with the view to gather more qualitative information on the similar issues covered in the household survey. The discussions lasted for between one-and-half and two hours and were audio recorded. These were then transcribed prior to analysis.

METHODOLOGY 13

ANALYSIS

The survey data was analysed using SPSS, a quantitative data analysis software package for social scientists. Mainly, basic Frequencies, Descriptive statistics, Cross tabulations and Chisquare analyses were conducted to bring about the results of this study. Frequencies were conducted to measure the prevalence rates (e.g., to what extent a particular service is available or what percentage of the respondents reported availability of a particular service), cross tabulations were conducted in order to establish whether there were differences between municipalities in terms of the availability and/quality of a particular service, and finally, a Chisquare test was conducted to establish the significance of differences between municipalities in terms of service delivery.

LIMITATIONS

As with any other study, certain limitations must be borne in mind when reading and interpreting the findings of this study. First, a sample size of 5 158 questionnaires instead of the intended 5 200 was realised, captured and analysed.

Second, the amount of time within which the study had to be completed was significantly tight considering the amount of work that needed to be done. As a result, the study was conducted rapidly in order to meet the deadline set by the Department of Local Government and Housing of the Limpopo province. Owing to this, some of the processes such as training of fieldworkers had to be done with rapid speed.

The third limitation is related to the first and second limitations. During quality assurance, it became clear that some of the fieldworkers, especially those who were first time recruits, did not grasp all the necessary details highlighted during the training. This was made evident by the number of questionnaires we found to be of poor quality hence they could not be used in the analysis. In the end, 42 questionnaires could not be used for analysis, leaving the total number of questionnaires at 5 158 instead of the targeted 5 200.

The fourth limitation is that there was no age specification in this study. This is to say that any person living in the province and had some household decision-making powers was eligible to partake despite age. As a result, the age of the study participants ranged form the mid-teens to over 90 years of age.

METHODOLOGY 15

3. SURVEY FINDINGS

REALISED SAMPLE SIZE

This section reports on the total number of questionnaires completed, captured and analysed in the current report in relation to the originally intended sample size.

•.	Intended (N)	Realised (N)	%
Aganang	200	170	85%
Ba-Phalaborwa	200	200	100%
Bela Bela	160	160	100%

	2322 952 525 501 409 260 162	

Table 3: Area type

A large proportion of areas in the province were found to be formal village settlements (45%), followed by urban formal townships. Areas described as suburbs, usually characterised by an affluent population and established service delivery system, and informal urban townships accounted for only 3% and 5% respectively.

While municipalities such as Ba-Phalaborwa, Modimolle and Polokwane showed a spread of different types of areas, with urban formal townships and village formal settlements dominant, municipalities such as Aganang, Blouberg, Fetakgomo and Molemole were found to be almost completely made of formal village settlements. It was interesting that in the latter municipalities no areas described as suburbs were found, except for Aganang municipalities in which only 1% was described as a suburb.

Majority of the farms are concentrated in the Mookgopong municipality, accounting for almost three-quarters of the area. Over half of the areas in the Greater Giyani municipality, which is more than any other municipality, are described as traditional village settlements.

HOUSEHOLD AND DEMOGRAPHIC DETAILS

This section investigated, and reports on the demographic details of the people who took part in the study. The section reports on the gender of the respondents, age, levels of education, the language of the respondents and their employment status.

0	N	%
Some high school: Grade 8-11 or Std 6 - Std 9	1335	26%
None	968	19%
Matric or grade 12	859	17%
Some primary: Up to Grade 4 - 6 or Std 2 - Std 4	800	16%
Primary completed: Grade or Std 5	476	9%
Post-matric - diploma or certificate, not degree	409	8%
Some high school plus trade certificate or diploma	111	2%
Degree completed	113	2%
Degree incomplete	69 •	1%
More than one degree .	15	
Total	5155	0% 100%

Table 7: Highest educational qualification

The level of education is generally low among the respondents, with the largest proportion of the respondents, about a quarter (26%), having completed some high school only, followed by one-fifth (19%) who have no schooling at all. The respondents who have completed some postmatric qualification such as a diploma, trade certificate or degree accounted for only 12%.

	N	%
Sepedi - North Sotho	2520	49%
Xitsonga - Shangaan	1266	25%
Tshivenda	778	15%
Sesotho - South Sotho	106	2%
Setswana	113	2%
Afrikaans	103	2%
Siswati – Swazi	64	1%
IsiNdebele	57	1%
IsiXhosa	23	0%
IsiZulu	26	1%
English	69	1%
Other language	16	0%
Total	5140	100%

Table 8: Language of the respondents

There are three languages mostly spoken by the respondents. The most spoken language is Sepedi (49%), followed Xitsonga (25%) and Tshivenda (15%). Only 2% and 1% of the respondents reported that they mostly speak Afrikaans and English, respectively.

Findings from this section are further used to assess different municipalities' overall performance on service delivery.

HOUSING

		N	%
	House - formal structure on a separate stand	3466	67%
Formal	Room in house - backroom	444	9%
	Flat in a block of flats	78	2%
Informal	Shack on own stand	392	
- Intormat	Backyard shack	110	67%
	Traditional dwelling or hut	630	
	Other	34	
	Total	5153	

Table 10: Type of dwelling of households

Majority of the households (67%) occupy formal houses on separate stands. This includes both the houses supplied by the government (RDP houses, as commonly known) and houses financed or built by individuals. Generally, close to 8 in 10 of respondents reported that they lived in some form of a formal house, i.e., formal house on a separated stand, flat in a block of flats or room in a house.

Other dwellings visited include hostels, which housed 13 respondents, and mixed dwellings consisting of formal housing and traditional dwellings on the same stand, in which 16 respondents claimed to live.

The municipalities in which the respondents were most likely to report living in formal dwellings are Aganang, Fetakgomo, Greater Letaba, Greater Groblersdal, Greater Marble Hall, Lepel-Nkumpi, Molemole, Musina, and Polokwane.

Informal dwellings were more likely to be found in Bushbuckridge, Lephalale, Modimolle, Mogalakwena, Mookgopong, and Thabazimbi; while traditional dwellings were more likely to be found in Ba-Phalaborwa, Greater Giyani, Greater Tzaneen, Mutale, and Thulamela.

Thabazimbi were less likely to express satisfaction with their dwellings. This, however, should not be misinterpreted to suggest that the respondents in these municipalities do not own their dwellings.

	N	%
Own it	3804	74%
Just live here	1047	20%
Rent it	296	6%
Total	5147	100%

Table 14: Mode of Accommodation

Ownership of the dwellings was widely reported by the respondents. About three-quarters of the respondents (74%) owned their dwelling while one-fifth (20%) reported that they just lived there.

Ownership of the dwellings was mostly reported in Ba-Phalaborwa, Blouberg, Greater Giyani, Greater Tubatse and Thulamela municipalities. On the other hand, respondents in Lephalale, Mookgopong, and Thabazimbi were less likely to own their dwellings. Of those who did not own their dwellings, three quarters (76%) reported that they needed their own housing.

Only those who did not own their dwellings were asked if they needed their own housing, and respondents in Greater Letaba, Modimolle and Thabazimbi were more likely to express a need for their own housing, while respondents in Polokwane, Molemole, Mogalakwena and Greater Groblersdal were less likely to say that they needed their own housing.

	N	%
Yes	3959	78%
No	1153	23%
Total	5111	100

Table 15: Awareness of housing provided by government in the area

The majority of respondents (78%) appeared to be aware of housing provided by the government in their area.

Respondents in Bushbuckridge, Greater Giyani, Greater Marble Hall, Molemole, Mutale and Thulamela were more likely to be aware of housing provided by the government in their

Piped water appears to be the most common source of water in the province. Majority of the respondents (76%) reported street taps, on-site taps or piped water in dwelling as their main sources of water, with street taps being the most commonly reported source (30%).

Polokwane is the only municipality in which more than half of the respondents (55%) reported piped water in dwelling as their main source of water. This was followed by respondents in Ba-Phalaborwa, BelaBela and Thabazimbi where slightly less than half in each reported a similar source.

Over two-thirds of the respondents in each of the Blouberg and Greater Marble Hall municipalities, and slightly less than 6 in 10 respondents in the Makhudutamaga municipality, reported street taps as their main source of water.

It was interesting that piped water (whether in the form of piped water in dwelling, on-site taps or street taps) was the only reported source of water among the respondents in Ba-Phalaborwa.

	N %	
No	3231	66%
Yes, pay for amount of water used	1277	26%
Yes, pay flat rate each month	253	5%
Yes, pre-paid	132	3%
Total	4893	100%

Table 18: Water source metered or paid for

Although the majority of the respondents reported piped water as their main source, about two-thirds (66%) indicated that they do not pay for their water as their water sources are neither metered nor paid for. Of the remaining one-third, the most (26%) reported that they only pay for the amount of water they use and the remainder either pay a flat rate each month or use a pre-paid system.

Polokwane municipality, followed by Musina, has the highest percentage of respondents reporting payment for the amount of water used while BelaBela has the highest percentage of respondents who reported paying a flat rate for their water usage on a monthly basis. The highest percentage of the respondents who reported using the pre-paid system was in the Greater Marble Hall municipality.

It is interesting that none of the respondents in Musina reported travelling more than 500 meters to reach their water sources. On the other hand, the highest percentage of those who reported travelling more than half a kilometre to get to their water sources are residents of Maruleng municipality.

	N	%
No	3533	69%
Yes	1580	31%
Total	5113	100%

Table 21: Awareness of free water allowance

About 7 in 10 respondents were not aware of the free basic water allowance (i.e., free 6000 litres allowance) provided by the municipalities.

While the respondents in Bushbuckridge, Greater Marble Hall, and Makhado municipalities were the most likely to report knowledge of the free basic water allowance, respondents in Blouberg and Greater Letaba municipalities were the least likely to report knowledge of the service.

	N	%
No	2275	54%
Do not know	1363	33%
Yes	561	13%
Total	4198	100%

Table 22: Access to free basic water (6000 litres)

As can be seen from Table 22, majority of the respondents do not have access to the free basic water provided by the municipalities in terms of the legislation. Only 13% reported that they have access and a third was unsure about whether the service is available to them or not.

It was striking that more than 80% of the respondents in Bela Bela and 60% in Modimolle reported having access to the free basic water service while hardly half of the respondents in each of all other municipalities reported having access to such service.

municipalities were more likely to report that they did not know what the main causes of the interruptions were.

	228 229 212 161 118 148 85

Table 25: Time taken to repair broken water supply

Looking at Table 25, it is difficult to ascertain any specific time period it takes to repair broken water supply. The findings suggest that restoring water supply can take anything between a few hours and a month or more. It was clear, however, that only under rare circumstances was the restoration of water supply done within just a few hours.

Among those who reported "other", some indicated that it takes between five and six months to reconnect the water supply while in some cases the water supply was never restored since the breakdown in 1999.

In Bela Bela, followed by Musina, respondents were more likely to report that the water breakdown is reconnected within hours of breaking down, while respondents in Blouberg and Greater Giyani municipalities were more inclined to report that it takes a month or more to reconnect.

	N	%
Municipality	2488	49
Other	1445	28
No-one	1201	23
Total	5133	100

Table 27: Entity responsible for the maintenance of taps and water sources

Less than half of the citizens (49%) reported that their municipalities are responsible for the maintenance of taps and other water sources in their communities. About a quarter reported that the taps and water sources are not maintained by anyone. However, about three in ten reported that the water sources are maintained by "other" entities such as private contractors, farm owners, individuals employed by the community, community members themselves, and community leaders, among others.

Respondents in the Greater Giyani (86%), Ba-Phalaborwa (84%) and Mogalakwena (76%) municipalities were more likely to report that their municipalities are responsible for maintaining the water sources while the respondents in the Greater Tzaneen municipality, followed by Molemole and Greater Groblersdal, were more likely to report that there is no one maintaining the water sources. "Other" entities such as community leaders were mostly reported by the respondents in Aganang and Maruleng municipalities.

	N	%	
Don't know	1879	48%	
Monthly	638	16%	
Other	625	16%

Table 35: How often do you receive an electricity account?

Over eighty percent (82%) of the households do not receive their electricity accounts while the remainder (18%) receive monthly statements. The municipalities that are mostly likely to send electricity accounts on a monthly basis are Maruleng (51%), Ba-Phalaborwa (44%), Thabazimbi (42%), Polokwane (41%) and Bela Bela (40%).

7	N	%
Pre-paid card	3330	75%

Other	87	2%
Solar, wind generators, petrol or diesel generators	2	0%
Total	4436	100%

Table 36: How does the household pay for its electricity?

The results in Table 36 clarify the results in Table 35 which suggested that less than a fifth of the electricity consumers received electricity accounts. As shown here, three-quarters (75%) of the households use pre-paid card system to pay for their electricity. Only 15% use the conventional meter system. The respondents in Maruleng municipality (54%) are the most likely to report using the conventional meter to pay for their electricity.

No	3487	79%
Yes	938	21%
Total	4425	100%

Table 37: Awareness of free electricity allowance

The levels of awareness are generally low with regard to free basic electricity allowance. Close on four-fifths (79%) of the respondents are not aware of the free electricity allowance.

SURVEY FINDINGS

Majority of the disruptions of electricity supply are due to general electricity failure (70%) while only 8% of the electricity disruptions are attributable to monetary problems such as inability to pay for pre-paid electricity or paying the account.

The general electricity failure was reportedly less prevalent in Blouberg (9%) while the disruptions related to money-related problems are more prevalent in Modimolle (56%), Maruleng (35%) and Mookgopong (35%) municipalities.

Table 44: Main type of sanitation facility used by households

Majority of the respondents (87%) have some form of sanitation facility as opposed to only 10% who have none. The largest proportion (40%) reported that they use basic latrine as their main type of sanitation facility, followed by about a quarter (24%) who use a full waterborne flush toilet. Respondents in Bela Bela, Mogalakwena, Mookgopong, Musina, Polokwane and Thabazimbi are mostly using full waterborne flush toilets, while septic tanks are common in Ba-Phalaborwa, Greater Giyani and Modimolle. Respondents in Aganang, Bushbuckridge, Greater Marble Hall, Makhado, Makhudutamaga and Mutale tend to use ventilated or improved pit latrines. Basic latrines are mostly reported in Fetakgomo, Greater Groblersdal, Greater Tubatse, Lepelle-Nkumpi, Molemole and Thulamela, and chemical and bucket systems are mostly reported in Lephalale and Maruleng, respectively.

Lack of sanitation facilities is prevalent among respondents in Blouberg and Greater Letaba municipalities who reported "other" facilities, particularly bushes.

Table 52: Level of satisfaction with refuse removal

Majority of the respondents (61%) are dissatisfied, or very dissatisfied with refuse removal in their area. Respondents in Bushbuckridge, Greater Letaba, Greater Marble Hall, Greater Tubatse and Thulamela are most likely to report being dissatisfied. In these areas, the majority reported that they dispose of their refuse by burying it or burning it as opposed to having it collected by the municipality or private companies.

COMMUNITY SERVICES AND FACILITIES

The main aim of this section was to investigate availability, accessibility and the quality (where they exist) of various community services and facilities in the province and in individual municipalities. In particular, the section focused on establishing whether services such as the police, postal and municipal bus services, among others, and facilities such as community halls, parks, sports grounds, and so forth, are available in various communities. Levels of satisfaction with these services and facilities were also investigated.

	Community Halls	Grass	Housing support	Municipal bus service	Municipal cemetries	Municipal health	Services Parks	Police services	Postal services	z

Table 54: Services and facilities available, by municipality (1)

Table 54 provides an indication of some of the services and facilities available in each of the municipalities. The table is continued below.

Besides for schooling, housing support services and municipal health facilities are the mostly reported facilities available in most of municipalities.

	Count	%
Accessing health services	2999	58%
Accessing welfare services	2324	45%
Road maintenance	1309	25%
Accessing community halls	1238	24%
Roads are tarred	1002	19%
There are street lights	836	16%
Walkways are paved	308	6%

Table 56: Availability of infrastructure (N = 5158)

The availability, and accessibility thereof, of infrastructure in these areas appears to be limited. Health services are the most commonly accessible services. However, less than half of the respondents (45%) are able to access welfare services, and only a quarter indicated that road maintenance or community halls are available. Less than 1 in 5 (19%) respondents indicated that roads are tarred in their area.

SURVEY FINDINGS

	Count	%

Table 61: Level of satisfaction with the community services and facilities provided by the municipality, by perceptions of whether the community has changed

Respondents who reported that their communities have stayed the same or deteriorated are most likely to be dissatisfied with the services and facilities provided by the municipality.

Reported satisfaction is highest in Ba-Phalaborwa (49%), Mookgopong (48%), Polokwane (48%), Maruleng (47%), Modimolle (47%) and Mogalakwena (46%). Levels of dissatisfaction are high in Greater Groblersdal (90%), Molemole (85%), Greater Tubatse (83%) and Fetakgomo (79%).

DISASTER MANAGEMENT

This section reports on the availability and questions of awareness around disaster management facilities in various municipalities. Respondents were asked to report on whether they know of the existence of such facilities in their areas as well as reporting on their accessibility and the quality of service delivered by these facilities.

SURVEY FINDINGS 53

Tubatse and Thulamela municipalities are the most likely to report dissatisfaction with the ambulance services.

	N	%
No	4168	82%

Efficient	927	18%
Very efficient	232	5%
Total	5126	100%

Table 72: How would you rate your ward councillor?

When asked to rate their ward councillors, the highest percentage of the respondents (46%) were of the view that they are inefficient, or very inefficient. The second highest percentage, about a third (32%), indicated that they do not have any opinion.

The municipalities in which the respondents were most likely to report that the councillors are inefficient are Greater Tubatse (77%), Fetakgomo (67%), Greater Groblersdal (65%), Greater Marble Hall (65%) and Lepelle-Nkumpi (62%), with Greater Tubatse having the highest percentage of the respondents who feel that the councillors are inefficient. In contrast, Greater

(86%), Musina (85%), Blouberg (84%) and Mookgopong (82%). On the other hand, the municipalities in which the respondents were more likely to report awareness are Greater Groblersdal (64%), Greater Marble Hall (63%) and Bushbuckridge (62%).

	N	%
No	3432	67%
Yes	1676	33%
Total	5108	100%

Table 75: Attendance of meetings organised by councillor or ward

Noting that only less than half of the respondents reported awareness of the meetings organised by councillors or the ward committee, it is not surprising that the attendance of such meetings is reported by only a third of the respondents (33%). The municipalities in which the respondents were most likely to report attendance of the meetings are Ba-Phalaborwa and Greater Groblersdal, 56% in each case. Lephalale and Mookgopong are the two municipalities in which the respondents are most likely to report non-attendance of ward committee meetings. In each of the two municipalities, 89% reported that they never attend the meetings organised by the councillor or the ward committee.

	N	%
Sometimes	1006	61%
Always	526	32%
Rarely	110	7%
Total	1642	100%

Table 76: Frequency of attending meetings organised by the councillor or the ward committee

Among those who reported attendance of the meetings organised by the councillors and/or the ward committees, the majority (61%) reported that they only attend them occasionally. Only about a third (32%) attends the meetings regularly.

The municipalities in which the respondents were most likely to report attending the meetings regularly are Ba-Phalaborwa (62%) and Thabazimbi municipalities (60%). On the other hand, Blouberg, Lepelle-Nkumpi and Lephalale are the three municipalities in which the respondents are most likely to report attending the meetings only rarely. There are no major differences between the municipalities in regards to the percentage of respondents who reported attending the meetings rarely.

The largest proportion of the respondents (50%) reported that they were dissatisfied with the impact of their participation in the municipal activities. This was followed by 28% who were indifferent.

The respondents in Ba-Phalaborwa (53%) followed by Modimolle (44%) and Maruleng (43%) were most likely to report satisfaction with the impact of their participation in the municipal activities while the respondents in the Greater Tubatse (81%) and Greater Marble Hall (80%) were more likely to report being dissatisfied. The municipalities in which the respondents were mostly like to report being indifferent are Bela Bela (62%) followed by Makhudutamaga (48%).

	N	%

Table 80: Municipality's performance with regard to service delivery

The largest proportion of the respondents, constituting about two-fifths (39%), reported that their municipalities' performance is bad. The second largest percentage, constituting slightly more than a third (36%), reported that their municipality's performance is average.

The municipalities in which the respondents were most likely to report that the performance is below standard are Greater Groblersdal (73%), Greater Tubatse (71%) and Aganang (57%).

programmes while those in Greater Tubatse (62%) and Thabazimbi (61%) were most likely to report that the poverty alleviation programmes are generally inaccessible in their areas.

PRIORITY FOR IMPROVEMENT

The last section of the questionnaire enquired about whether there were areas and services which the municipalities need to prioritise for improvement. The respondents were asked to rate their municipalities in so far as service delivery is concerned. They were also asked to suggest what the municipalities could do to ensure that they delivered the service with which the residents could be happy.

	N	%
Yes	4734	93%
No	374	7%
Total	5108	100%

Table 82: Proportion of respondents reporting that their municipalities' services need improvement

At least 9 in 10 respondents (93%) indicated that there is a need for the municipalities' services to be improved. Respondents in Modimolle (78%) and Aganang (79%) municipalities were the least likely to report that the municipal services require some improvement.

Among other suggestions, respondents indicated that the municipalities need to consult more with the communities, need to build schools in areas where children travel long distances to get to the nearest school, and the government needs to closely monitor service delivery, among others.

participants, the government's performance is judged on the basis of the quality of the services provided. Most of the participants complained about the number of times they experienced electricity cut-offs and duration thereof, as well as the taste and suspected impurity of water.

Among the participants in rural areas, the government's performance was questionable with regards to monitoring the public works programmes and services in general. Most of the participants in this category felt that the government is not doing enough to ensure that individuals and companies awarded the contracts to deliver service such as water and building low-cost houses are delivering up to the required standard. On the other hand, participants in urban areas felt that the government is inefficient in terms of handling accounts for the basic services such as refuse removal, water and rates and taxes.

MUNICIPAL SERVICES DELIVERY

This section was focused on understanding the participants' perceptions on the performance of their municipalities regarding service delivery. The participants were prompted to raise their views on the availability, quality and quantity of basic services provided by their municipalities. They were also asked to indicate their level of satisfaction with the municipal services, where applicable. The particular services focused on are water, sanitation, electricity, refuse removal, housing delivery and disaster management facilities.

WATER

Urban participants were more concerned about the management of water accounts by the municipalities, the cleanliness of the water and the water pressure. The participants reported that they often receive statements suggesting that they have used excessive amount of water which according to them does not reflect a true situation. About the quality of the water, some complained that the water pressure was low such that they were unable to use showers when bathing. In addition, some highlighted that they have been advised to boil the water before drinking it as it contained a disease-causing bacteria. One of the participants had the following to say:

"I want to talk about the quality of the water. I can't take bottled water to work everyday. I drink 2 litres of water a day and I must boil the water first and cool it off" (Urban, females).

The rural participants on the other hand raised concerns about a range of issues, from total unavailability of water to the quality. It was highlighted that in some villages only certain sections do get water while some do not. This shortage of water also affected essential services such as clinics and hospital. Participants reported that as a result, they are forced to buy water

Focus groups findings 65

The participants in the rural areas further raised concerns about the efficiency and accessibility of points of sale of recharge cards. They reported that the current pre-paid card vending system requires improvement in the form of better management and maintenance as the ones that they currently depend on are almost always not in a working order. As a result, they find themselves having to spend more money on transport to get to places were they could find vending machines which are in a working order.

REFUSE REMOVAL

Refuse removal services are non-existent in rural areas. Participants in the rural areas complained that absence of such a service makes their areas look untidy and it becomes dangerous to their livestock. One of the participants reported the following:

"On the issue of refuse, the municipality is doing nothing. You will find that there are lot of plastics in the streets and if animals eat that they will have to be killed because they won't survive. The sad part is we are making a living out of these animals" (Rural, males).

To curb the problem, most of them reported that they bury or burn their household refuse to try and keep their areas tidy. They, however, highlighted that it would be very beneficial if the municipality could provide a communal refuse bins in each village.

In the urban settings on the other hand, a key concern was raised with regard to the collection of household refuse. The participants highlighted that sometimes household refuse stays uncollected for several weeks yet they are expected to pay for the service. It was highlighted that the municipalities need to award contracts to companies which would carry out the service reliably.

HOUSING DELIVERY

Participants in the urban setting are not aware of any houses provided by the municipalities. Two main concerns were however raised by the participants in the rural settings concerning the government's housing delivery. First, participants are unhappy that they have been promised houses for a long time but the houses are still not built. They argue that the builders appointed by the government have come and built a few houses and took off without completing building all the houses they were supposed ton build. One of the participants reported the following:

"People who have been awarded the contracts do not finish their work. They have built some houses which are not finished and they have left" (Rural, males).

Second, there are concerns about the quality of the houses. There is a general feeling that the quality of the houses provided by the municipality was of a substandard. Respondents report that:

participants however reported that they only came in contact with them during the local government elections. One participant reported the following:

"We only met them when they were campaigning and the community agreed to let him be elected to give him a chance to see what he can do for the community. After he was elected, you never see him again until the next elections" (Rural, females)

The councillors are generally rated negatively. Some reported that their councillors are good at making promises but never delivering on them. However, the councillor was applauded in one of the areas for arranging for burial of some two old ladies who fell victims to criminals.

In terms of improving the systems of local governance, participants across the board understood that as citizens they need to play a role. They however added that the municipalities need to be accessible and increase their interaction with the communities. It was further added that the municipalities need not only grant contracts to companies to deliver services. It was felt that the contracted companies need to be closely monitored in order to ensure that quality service is delivered.

Focus groups findings

areas. This low level of development in the latter municipalities is likely to influence the communities' perception with regard to the government's performance on service delivery in general. As indicated in our findings section, people who report satisfaction with their dwelling structures are most likely to report satisfaction with the government's performance. It might therefore prove useful for the government to prioritise improvement of people's living conditions (e.g., by providing housing) in the specified municipalities in order to change the communities' perception regarding the government performances.

SERVICE DELIVERY

HOUSING DELIVERY

As reported earlier, although there are municipalities in which the dominant type of dwelling is informal and traditional, majority of the households in the province live in formal dwellings. This suggests that the problem of housing delivery is on a relatively low scale in the province. The situation however warrants some urgent intervention in municipalities such as Bushbuckridge, Lephalale, Maruleng, Greater Giyani, and Modimolle among others. These municipalities have a slightly higher percentage of households occupying informal dwellings, and the majority are dissatisfied with the government's performance on housing delivery.

In terms of ownership, majority of the households own their dwellings in the province. However, municipalities such as Polokwane, Molemole, Mogalakwena and Greater Groblersdal are dominated by households which do not own their dwellings, and among those who do not own their dwellings, over three-quarters said they need their own dwellings. This situation may be explained by a high influx of people into these municipalities as they are the main economic centres in the province. As a result, majority of the people in these municipalities may be migrant workers who own dwellings elsewhere. However, it is worth noting that even though these people might own dwellings elsewhere, majority of them indicated that they need to own dwellings in these municipalities as well. It may therefore be useful for the government to ascertain the number of those who own dwellings elsewhere before embarking on a programme to provide people with houses where as failure to determine this may lead to duplicates, i.e., providing people with extra houses when they have in fact been allocated houses in other municipalities.

get the water cut-offs fixed is difficult to ascertain as the responses varied. However, for most people, a day is a reasonable amount of time within which cut-offs are expected to be fixed.

By and large, municipalities in the province seem to be doing well with regard to the issuing and management of water consumption accounts as most of those who receive water accounts from their municipalities do not have problems with incorrect water accounts. This may be one of the reasons why more than half of the respondents are happy with the quality of water supply in their areas. As shown in Table 149 (see appendix A), on a scale of 0 - 1, with 1 representing good performance, Mookgopong (0.76) and Musina (0.76) are among the best performing municipalities. Fetakgomo (0.27), Greater Goblersdale (0.25), Greater Tubatse (0.24) and Molemole (0.22) are on the other hand among the worst performing municipality with regards to water supply. Municipalities such as Bela Bela (0.69), Modimolle (0.67) and Polokwane (0.63) are rated well above average.

ELECTRICITY SUPPLY

Although a notable percentage of households in the province use electricity for cooking, the largest proportion uses wood. There is however no question about energy source for lighting as close to 8 in 10 households reported that they use electricity. This could be interpreted to suggest that close to 80% of the households in province are electrified, a performance which can be regarded as satisfactory for the province.

Eskom is the main electricity supplier in the province, and most of the households use a prepaid card system as opposed to conventional meters. Noting that the pre-paid card system is dominant, it is not surprising that awareness of free electricity allowance is very low. The prepaid card system does not clearly indicate the amount of electricity received as free electricity allowance. If the government wishes to make the communities aware of this service, it may take a dedicated awareness campaign on the matter, and the easiest could be a reflection of the amount of electricity received as free allowance on the coupon. Although it may not seem a priority to make the communities aware of this service, the consequence of failing to do so may be dissatisfaction which may lead to apathy, especially among those who believe that they deserve free electricity allowance.

Disruptions in during the three months preceding the study were reported by two-fifths of the respondents and these were generally due to a general power failure. These were however fixed

are among the poor performing municipalities. In total, 20 of the 26 municipalities' performance is below average.

COMMUNITY SERVICES AND FACILITIES

Schools, housing support services, and to some degree, municipal health services, are the most commonly available community services and facilities in various municipalities across the province. However, community services such as grass cutting, storm water drainage, and recreation facilities such as parks and public sports facilities, multi-purpose centres and public libraries have only been provided on a very small scale. Quality of the services is also unsatisfactory in areas where they are available. The only services that are highly commended by the public for good quality are public libraries, schools, postal services and grass cutting services, where these exist. The rest are rated mostly as average, which suggests that the municipalities need to pay more attention with the view to improve the quality of the services in question.

Accessibility of the services is another issue that requires an urgent attention as it would appear that it is highly limited. Municipal health service is the most accessible service in comparison with other services such as welfare services, road maintenance, community halls, and street lights, among others. For majority of the citizens, their communities have stayed the same in the past five years. This suggests that most of the communities feel that a lot still needs to be done in terms of improving delivery on community services and facilities. Almost all the municipalities are seen as underperforming with regards to the delivery of community services and facilities (see Table 156 in Appendix A).

DISASTER MANAGEMENT

Similar to the community services and facilities, availability of disaster management services and facilities is limited. Facilities and services such as disaster management centres, ambulances, fire brigade and police stations are unavailable in most of the communities. It should, however, be understood that according to the Municipal Systems Act 32 of 2000, local municipalities are not obliged to establish disaster management centres, and this may be one of the key reasons why most of the local municipalities in the province do not have such centres. However, in areas where these services and facilities are available, their quality is to some extent satisfactory. What this suggests therefore is that the municipalities need to make

RECOMMENDATIONS

The recommendations outlined here are informed by the findings of the citizens satisfaction study conducted among the residents of the Limpopo province across all 26 municipalities. Various subjects under which the recommendations are made are outlined.

EDUCATION LEVEL

Despite various programmes such as Adult Basic Education and Training (ABET) and the Expanded Public Works Programme (EPWP) (which has an element of skills development) put in place by the national government in conjunction with provincial governments, the level of education and skills attainment in the province is still low. A recommendation we would like to make here is that these government programmes need to be targeted, especially at those individuals to whom they would make a significant difference. The government, especially at the local level, needs to ensure that the programmes are accessed exclusively by those individuals who fit the criteria and have demonstrated commitment to such programmes.

EMPLOYMENT CREATION

Although the level of unemployment in the province was found to be on par with the national rates at 40%, proper targeting of employment programmes such as the EPWP would ensure that only those people who are indigent and need to earn income are employed rather than having a *laissez-faire* situation where any individual could get employment on the programme even if they do not meet the criteria to be employed on such programmes. Furthermore, proper management and monitoring of the projects falling under the EPWP by the municipalities is essential for the realisation of the employment creation object of the programme.

HOUSING DELIVERY

A clear backlog has been identified with regard to the provision of houses by the government. In some municipalities, the dominant type of housing remains informal and traditional housing structures. There is therefore an urgent need for the government to intervene in the affected municipalities of Greater Giyani, Mogalakwena, Bushbuckridge, Greater Tzaneen, Mutale, and Thulamela, among others identified.

RECOMMENDATIONS 77

ELECTRICITY SUPPLY

Capable transformers should be installed in areas where electricity supply is via overhead electricity cables to minimize electricity disruptions due to minor weather effects and overloading. Communities should also be advised of electricity cut-offs well in advance so that they could make alternative arrangements. Furthermore, pay points should be more accessible, well-maintained and user friendly.

Generally, more areas still need to be electrified in consultation with the Department of Minerals and Energy (DME) and Eskom.

SANITATION

Each household must be assisted with a basic sanitation facility by the municipalities as per Centre for Scientific and Industrial Research (CSIR) and the South African Bureau of Standards (SABS) guidelines, to eliminate disease-causing pathogens and ground water pollution. Programmes to assist the community in emptying of the latrines should be put in place in conjunction with the Department of Agriculture and the Department of Environmental affairs, with the possibility of job creation at community level.

REFUSE REMOVAL

Every household must be provided with rubbish bins, which will have to be collected regularly. Communities should be trained on environmental issues to understand the benefits of a clean environment. More dumping sites should be built in accordance with environmental specifications.

COMMUNITY SERVICES

All community services must be looked into as per individual municipality's requirements. Infrastructure level has to be improved. There is a need for Multipurpose Community Centres (MPCC) to ensure easy access to government and municipal services. Communities need to be improved through implementation of various projects, which will help with poverty alleviation
